1 Overview

This report summarizes responses from the Webinar 2 survey for the RGSM Options Tool. It includes participant information, response rates, closed-ended question summaries, plots for the choice questions, and tables of open-ended responses.

Survey overview

Metric	Value
Total survey responses	12
Unique participants	12
Closed-ended questions summarized	5
Open-ended questions summarized	3
Two-option charts produced	5

Participants

First name	Last name	Full name
Thomas	Archdeacon	Thomas Archdeacon
Jen	Bachus	Jen Bachus
Lucas	Barrett	Lucas Barrett
Andy	Dean	Andy Dean
Carolyn	Donnelly	Carolyn Donnelly
Eric	Gonzales	Eric Gonzales
Grace	Haggerty	Grace Haggerty
Aubrey	Harris	Aubrey Harris
Debra	Hill	Debra Hill
Casey	Ish	Casey Ish
Anne	Marken	Anne Marken
Michael	Porter	Michael Porter

2 Participant List

3 Response Rate by Question

4 Closed-Ended Question Summary

5 Two-Option Question Plots

The plots below show counts and percentages for all two-option questions.

Response rate by question

Question	Responses	Total participants
Decision 1: Should ecological function and cultural flows be combined?	12	12
Decision 2: If kept separate, which objective should include river drying?	12	12
Decision 3: Is TMDL a reasonable proxy for cultural flows?	12	12
Decision 4: Are TMDL and river drying duplicative?	12	12
Decision 5: If one should be retained, which should remain?	9	12

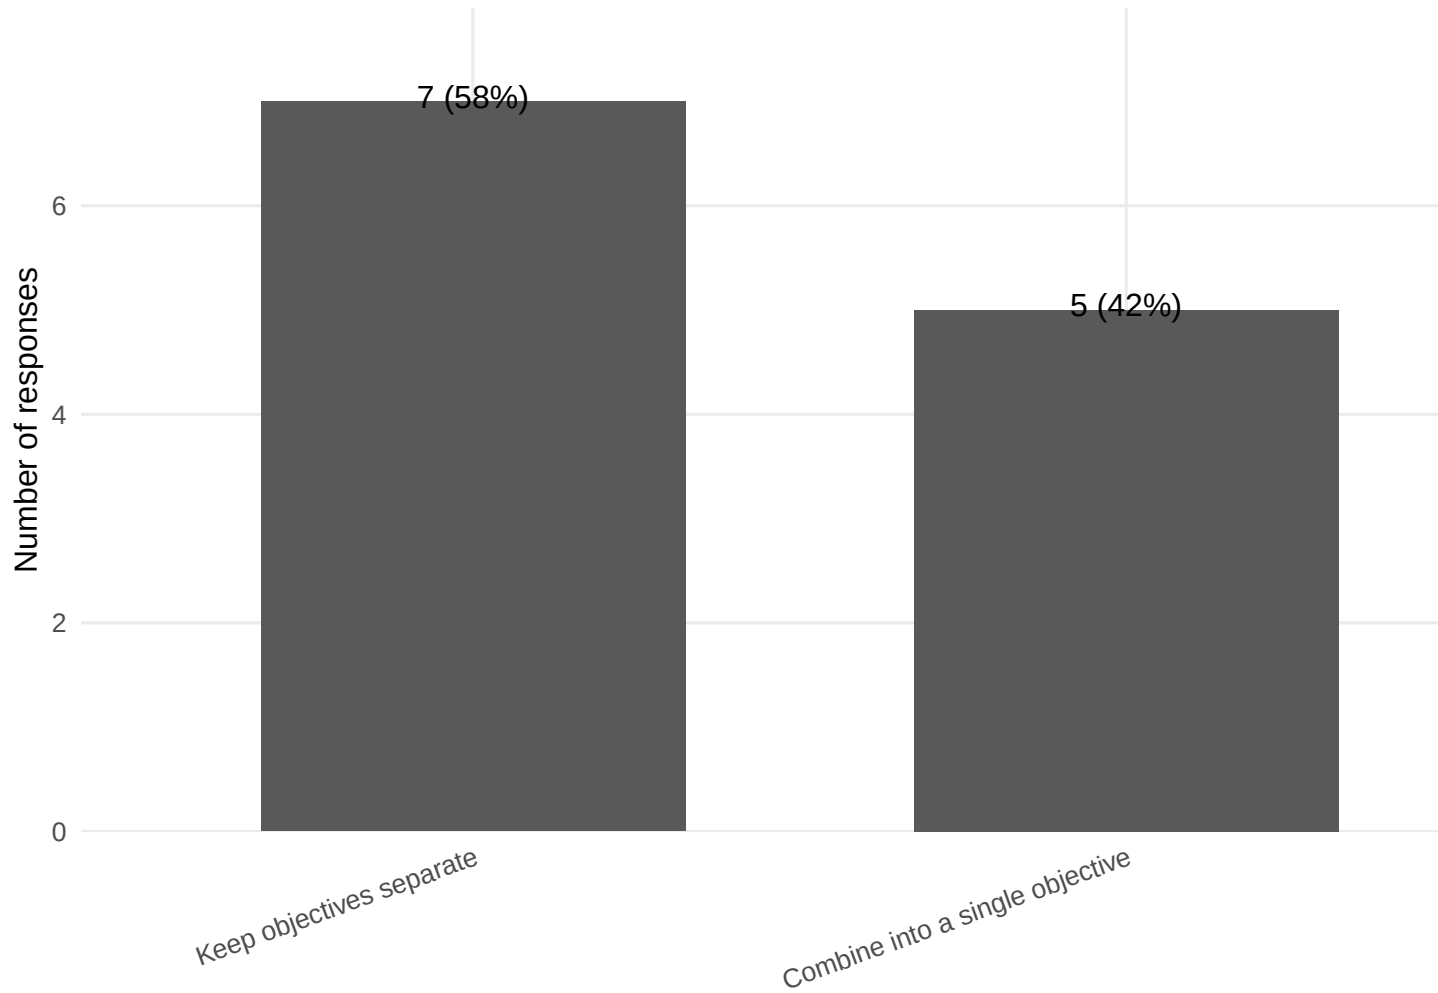

Closed-ended question summary

question_label	Keep objectives separate	Con
Decision 1: Should ecological function and cultural flows be combined?	7 (58.3%)	
Decision 2: If kept separate, which objective should include river drying?	NA	
Decision 3: Is TMDL a reasonable proxy for cultural flows?	NA	
Decision 4: Are TMDL and river drying duplicative?	NA	
Decision 5: If one should be retained, which should remain?	NA	

5.1 Decision 1: Should ecological function and cultural flows be combined?

Decision 1: Should ecological function and cultural flows be combined?

n = 12 respondents

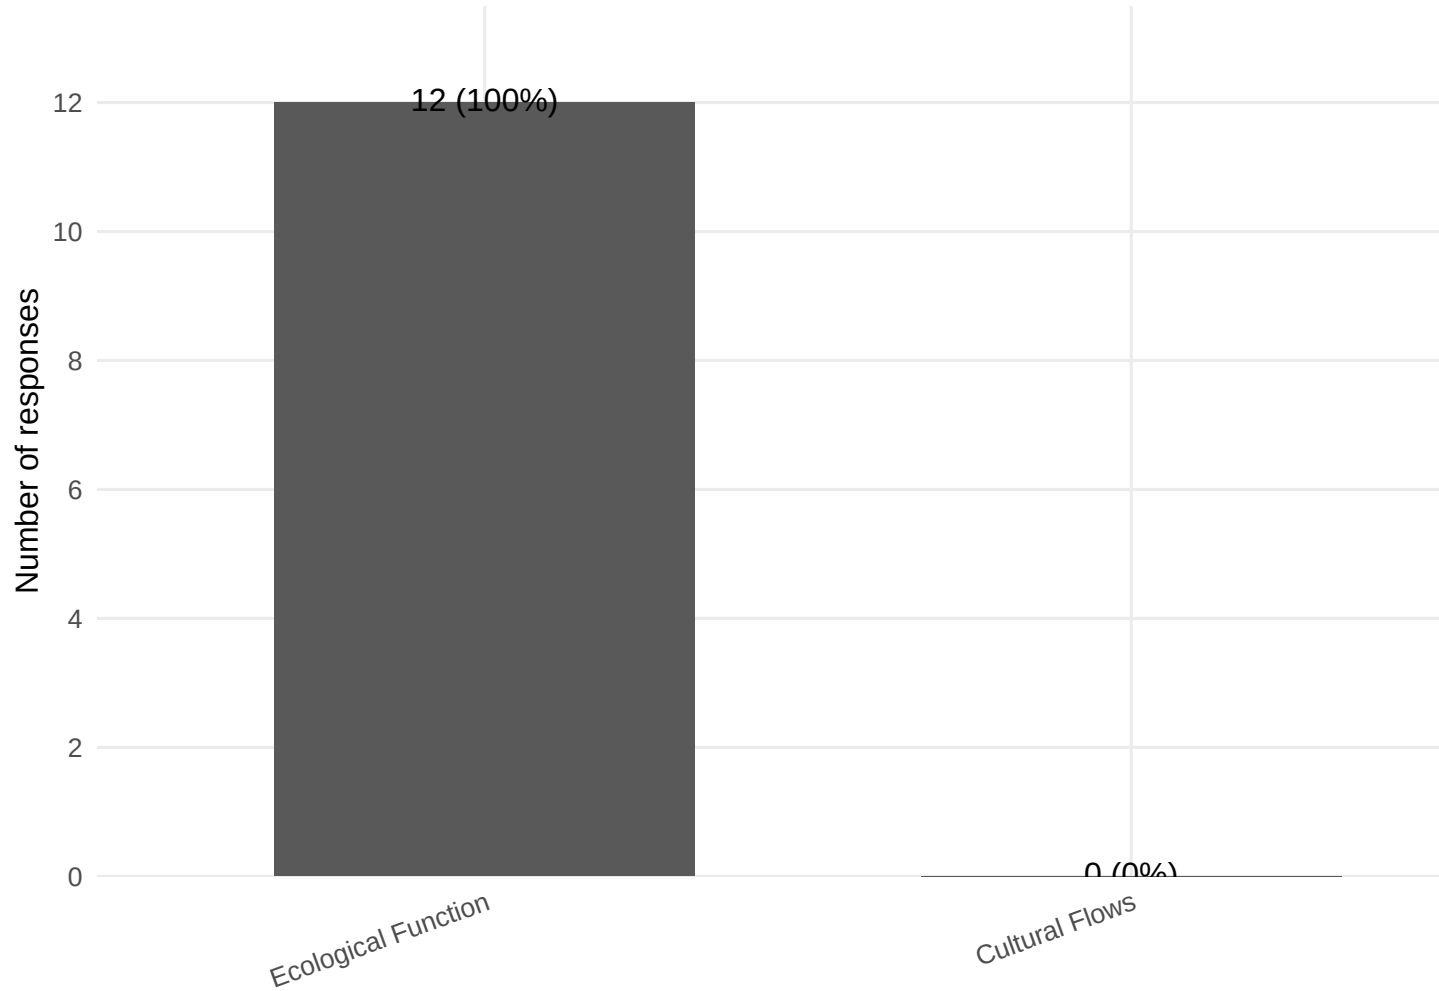

Percentages are calculated from non-missing responses for each question

5.2 Decision 2: If kept separate, which objective should include river drying?

Decision 2: If kept separate, which objective should include river drying?

n = 12 respondents

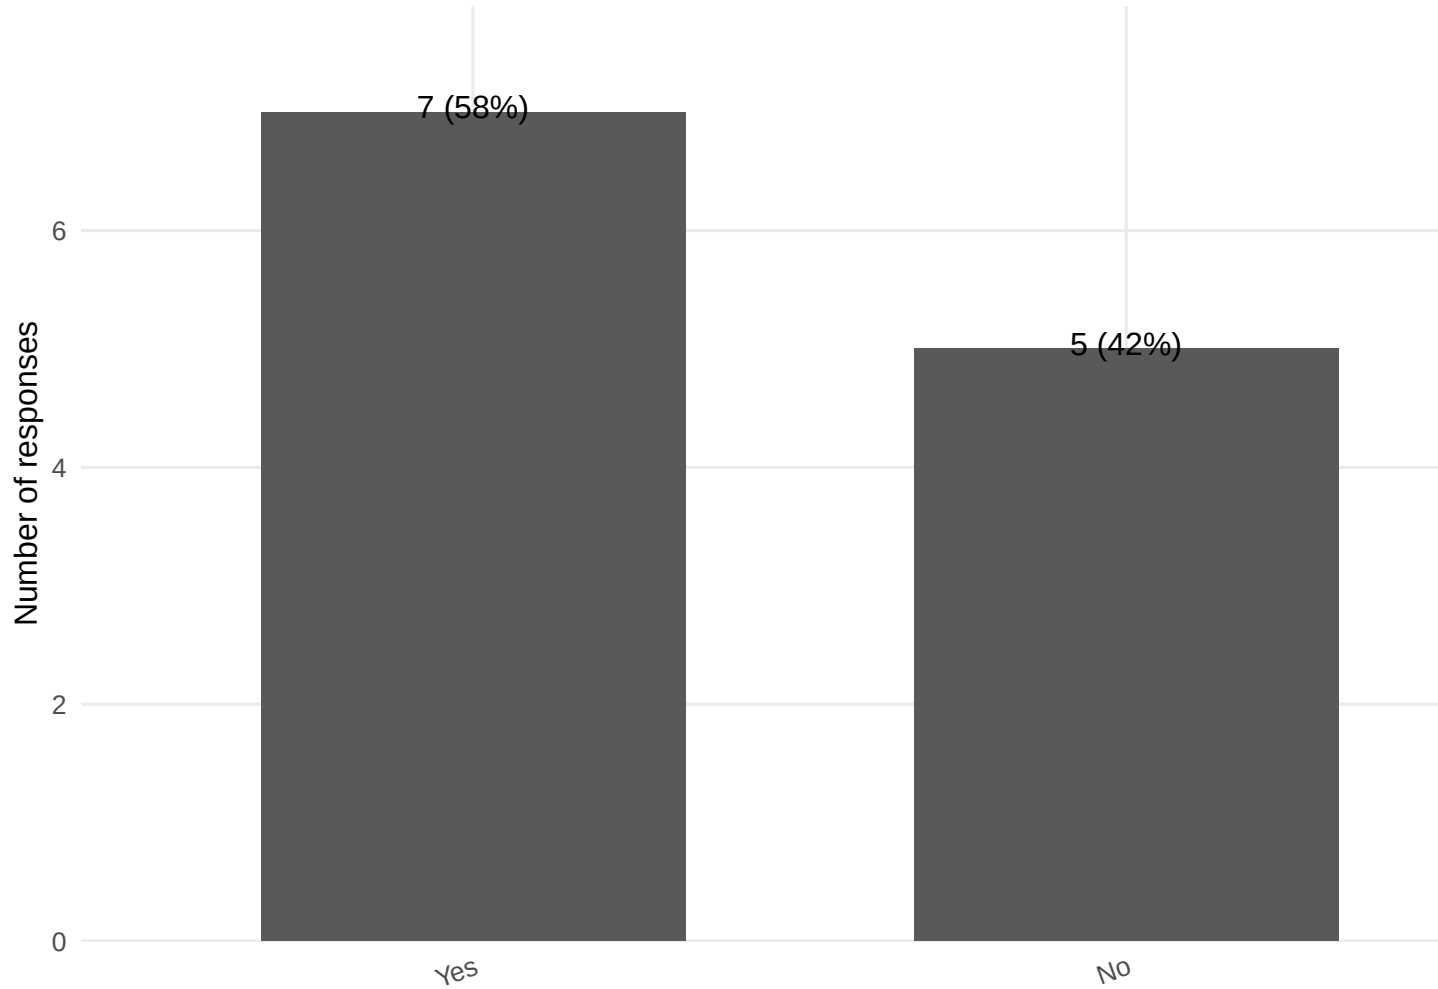

Percentages are calculated from non-missing responses for each question

5.3 Decision 3: Is TMDL a reasonable proxy for cultural flows?

Decision 3: Is TMDL a reasonable proxy for cultural flows?

n = 12 respondents

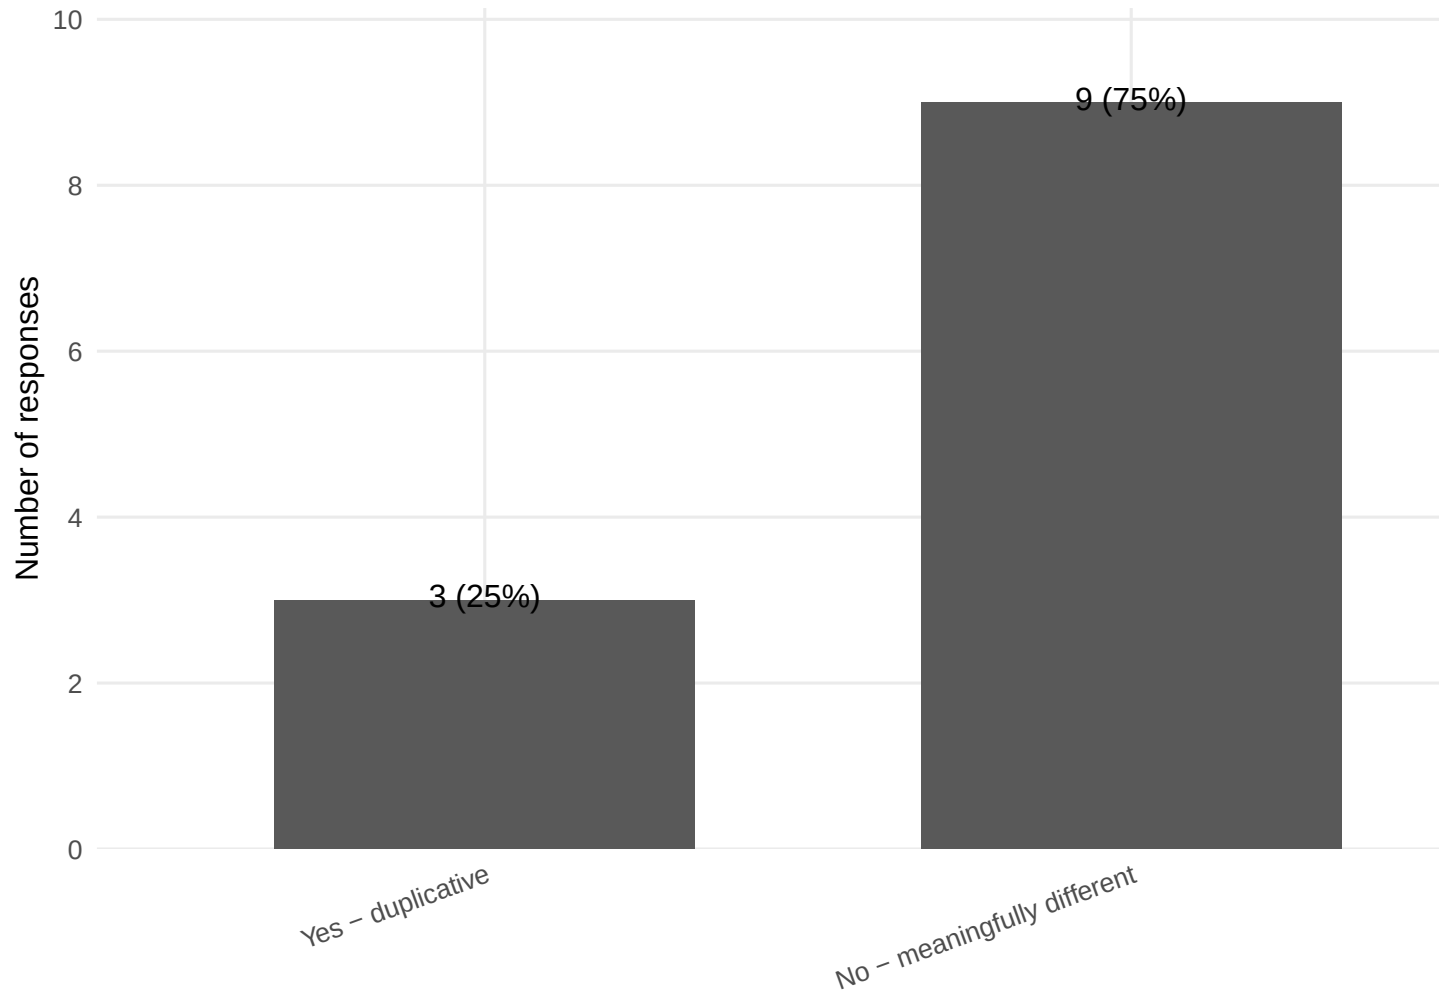

Percentages are calculated from non-missing responses for each question.

5.4 Decision 4: Are TMDL and river drying duplicative?

Decision 4: Are TMDL and river drying duplicative?

n = 12 respondents

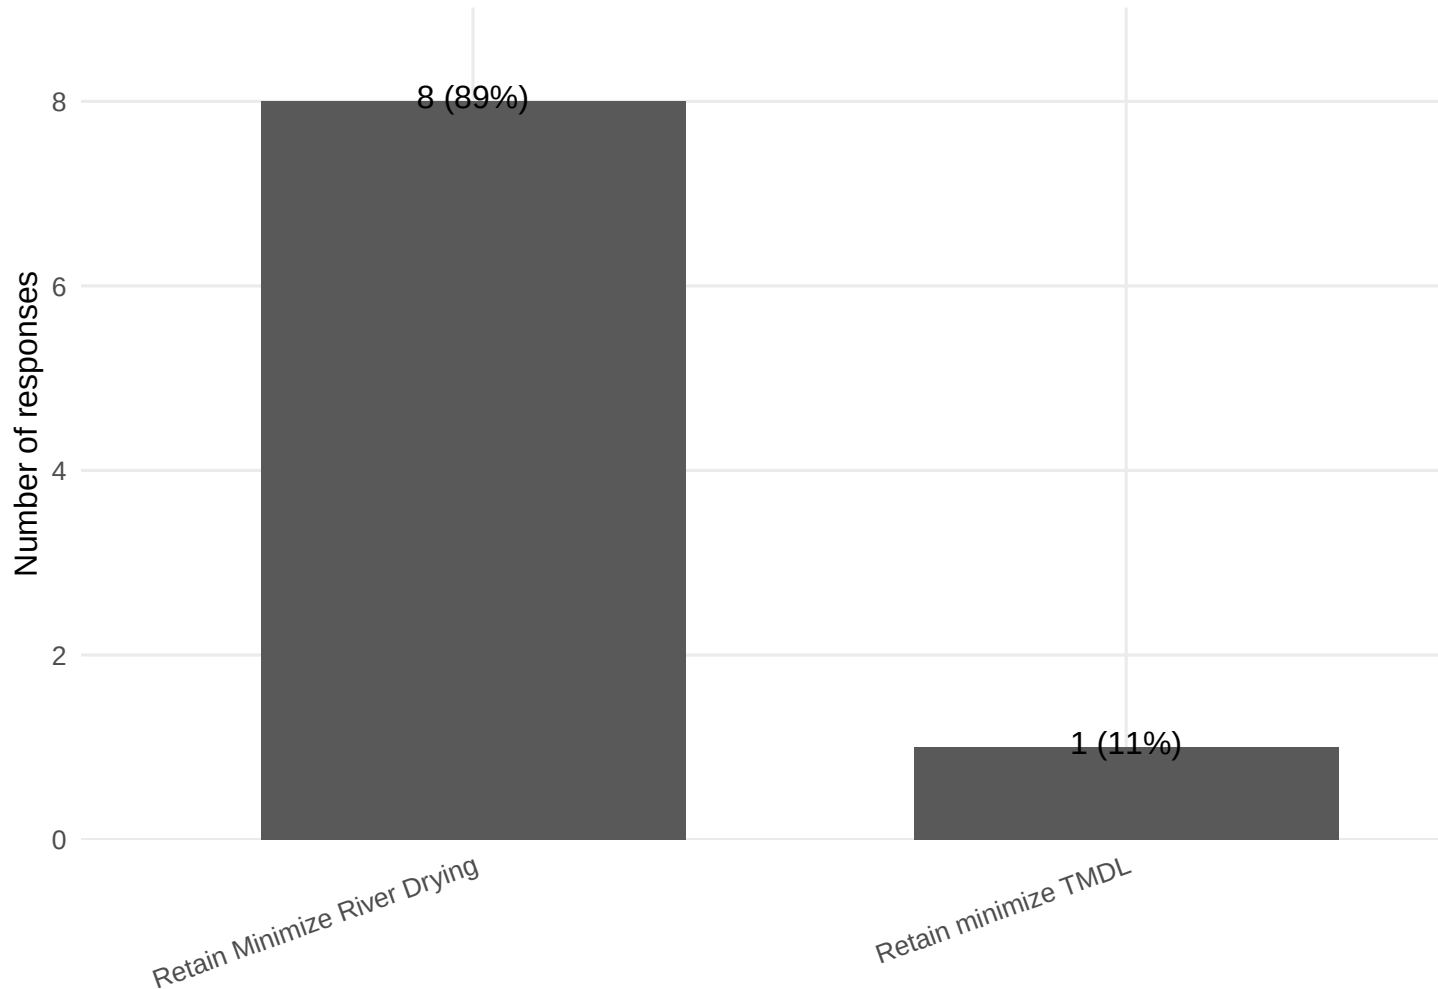

Percentages are calculated from non-missing responses for each question.

5.5 Decision 5: If one should be retained, which should remain?

Decision 5: If one should be retained, which should remain?

n = 9 respondents

Percentages are calculated from non-missing responses for each question.

6 Open-Ended Responses

6.1 Open-ended: Reasoning

Open-ended: Reasoning

Participant

Response

Aubrey Harris

Were tribes with P&P water consulted whether these are one and the same or different objectives? Is it possible that with better collaboration P&P water would be an opportunity, not considered a constraint? I.e. using P&P water for both ecological and culturally specific needs.

Lucas Barrett

I am more for just removing cultural flows. If the definition of cultural flows is the tribes having enough water for their ceremonies, this is not something that can be determined through modeling and doesn't have anything to do with river drying. The river can be dry in areas due to MRGCD diverting all of the water through their canals, and this enables the tribes to have water for their ceremonies, but the river will still be dry. With Prior and Paramount storage, it is extremely unlikely that they would not have enough water for ceremonial purposes.

Eric Gonzales

Seems they should be separate since cultural flows are pertaining to human wants and needs. Managing flows for ecological function is often at odds with cultural views of what flow should be.

Debra Hill

Cultural flows and Ecological Function may not have the same timing needs

Grace Haggerty

Cultural flows may be very specific related to ceremonies and culturally significant timeframes and aren't related to ecological function of the river.

Thomas Archdeacon

These may have both converging and diverging uses of water (some ecological flows may also be culturally positive, but some may not)

Jen Bachus

Decisions will need to be informed by both and lose resolution if combined.

Carolyn Donnelly

it is not how we operate

Andy Dean

Providing water for cultural flows should also automatically be ecologically good and vice versa.

Casey Ish

Combining these likely accomplishes the same general outcome

Michael Porter

Ecological function can provide a broader objective that includes cultural flow.

Anne Marken

These objectives have similar metrics because meeting the goals of one objective means you are likely meeting the goals of the other. These do not need to be considered independently.

6.2 Open-ended: Concerns or reservations

Open-ended: Concerns or reservations

Participant

Response

Aubrey Harris

Without consultation with the tribes involved with P&P water, it's impossible to say what the cultural values are. From my limited knowledge, cultural concerns are related to erosive flows and floodplain reconnection, which are not captured by river drying nor TMDL..

Lucas Barrett

Minimizing river drying has very little effect on Pueblos, so it should not be included under them. The only way to determine if they have enough water would be to evaluate the water that they have at their canal headings at any given time. There is no model that does this.

Eric Gonzales

none

Grace Haggerty

I don't have reservations now, but may need further education on why these two performance metrics, river drying and TMDL, were originally assigned to cultural objective.

Thomas Archdeacon

None other than the realism of actually being able to limit river drying

Jen Bachus

Supporting cultural values is not necessarily tied to TMDL/water quality or river drying - river drying has always occurred and so it is cultural embedded in some ways with irrigation and river management. If ecological function is maintained, then cultural flows likely will benefit. So we don't lose value by placing river drying/TMDL in ecological function.

Andy Dean

No

Casey Ish

No

Michael Porter

Will benefit from discussion with pueblo government to ensure the objective incorporates their perspectives.

6.3 Open-ended: TMDL feedback

Open-ended: TMDL feedback

Participant

Response

Aubrey Harris

I think TMDL is a use concern for many people, not just tribal perspective. Also, I don't know how TMDL would link directly environmental flow decision.

Lucas Barrett

From my understanding, except for Isleta, most of the Pueblos are closer to the top of the MRG system and do not generally have issues with pollutants. If we are trying to get to what Pueblos have enough water, this is generally not a huge consideration except for maybe the Isleta Pueblo.

Eric Gonzales

Minimizing TMDL would be difficult to achieve in the MRG.

Grace Haggerty

I am sorry, I wasn't at the last meeting held so my understanding of the importance of TMDL to river drying is unclear. I don't see river drying and TMDL as related unless you are specifically concerned with upstream discharges. For cultural purposes this would only be a concern for Isleta Pueblo due to treated water from

ABQ when flows are low. TMDLs can be very high during high flows, monsoons and flooding or accidental discharges.

Thomas Archdeacon

I don't know enough about TMDL to answer this question properly, but I don't think they are 100% duplicative

Jen Bachus

For a highly sediment laden river system, TMDL may not be as meaningful as it is for streams higher in the watershed. Pollution levels are not a driver currently for river management decisions. If something has to go, TMDL should be removed way before river drying (presence of the river itself).

Carolyn Donnelly

for the most part I don't know the answers related to TMDL but your survey required that I put in answers

Michael Porter

Including TMDL emphasizes the value / advantages of constructing a new upstream wastewater treatment facility by ABCWUA.

7 Notes

- Percentages are based on non-missing responses for each question.
- Non-respondents: David Kitcheyan, Patrick Taber, Jenny Davis, Alison Hutson, and Reynalden Delgarito.
- No responses from the BIA.
